20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Eighty percent of the sky has been surveyed at effective wavelengths of 4.2, 11.0, and 19.8 microns. Positions and magnitudes are presented for 3198 celestial sources detected.		

Preface

Performance of a rocket-borne infrared sky survey requires a team effort. Many individuals and organizations have contributed significantly to various aspects of the program.

The telescope was developed at Hughes Aircraft Co. under the guidance of Jackson Steffes, Richard Heddon, and John Heintz.

Both the rocket attitude control system and payload recovery system were developed at Space General Corp (now Aerojet Liquid Rocket Co.) under the direction of Mike Watson and Clifford Chalphant. Special thanks go to Joe Meyer, John LaBuda, William Frognone, Arthur Takeda, and Philip Meridith for their engineering genius and excellent field support.

The rockets were prepared and launched by the U.S. Naval Ordnance Missile Test Facility. We are especially grateful for the untiring support of "Gunner" Lloyd Briggs (USNOMTF), Ray Petracek (ALRC), Gordon Haiken (ALRC), and Fred Lemmon (NMSU).

Overall design of the payload instrumentation system and telescope mounting was performed by the Aerospace Instrumentation Laboratory of AFCRL under the direction of C. Nealon Stark, whose depth of experience and engineering ingenuity were largely responsible for the success of the rocket program. We wish to particularly acknowledge Paul Hartnett, Daniel Nardello, Ed LaBlanc, Larry Smart, and Thomas Campbell of the Wentworth Institute for their contributions to fabrication, integration, and field support of the payload system; and Charles Howard, Raymond Wilton, William Miller, Eban Hiscock, and Philip Gustafson (all of AFCRL) for their valuable technical inputs and coordination of group efforts.

Preceding page blank

The dual FM/PCM telemetry systems were built and prepared by Richard Buck, Dale Costner, and Claude Gwinn of Oklahoma State University.

Design and development of the stellar aspect system, alignment of the optical sensors, refurbishment of the infrared telescope between flights and preparation of the telescope for flight was accomplished in the Optical Physics Laboratory of AFCRL by Peter C. Tandy, David Akerstrom and Michael Mitchell under the direction of Charles V. Cunniff. Anthony D'Agati supplied launch window calculations, advice and numerous computer routines necessary for display and analysis of the flight data. Computer reduction of the vast quantities of flight data was facilitated by Leonard Marcotte and his intimate knowledge of the AFCRL CDC 6600.

We are indebted to Dr. Thomas L. Murdock for his many helpful discussions and assistance in the field.

We would like to thank J. W. Sulentic and W.G. Tifft for supplying us with their RNGC catalog on computer tape produced under NASA Grants NGR 03-002-032 and 03-002-091. We are also grateful to R.S. Dixon for a copy of the OSU radio survey on tape.

This program was sponsored in part by the Advanced Research Projects Agency. We are grateful to Mike Dow, Robert Paulson and James Justice for their support.

AFCRL Infrared Sky Survey
Volume I. Catalog of Observations
at 4, 11, and 20 Microns

1. INTRODUCTION

During 1971 and 1972, the Air Force Cambridge Research Laboratories conducted a survey of the sky in the intermediate infrared spectral region. The objective of this was to obtain the brightness and spatial distribution of a representative sample of the types of celestial objects that emit strongly in the infrared. Of primary concern was the determination of the positions of unusual sources of emission with sufficient accuracy to enable them to be acquired by ground based telescopes for further detailed investigation.

2. INSTRUMENTATION

The survey was performed using a small cryogenically cooled rocket-borne telescope. Interference filters placed in the cross scan direction in front of a multi-element detector array located at the telescope focal plane, permit almost simultaneous measurements in three spectral regions. The three bands have effective wavelengths of 4.2, 11.0, and 19.8 microns and bandwidths of 1.5, 5.1, and 5.6 microns respectively.

(Received for publication 10 July 1975).

Figure 2. Distribution of 11 Micron Sources Plotted in Celestial Coordinates

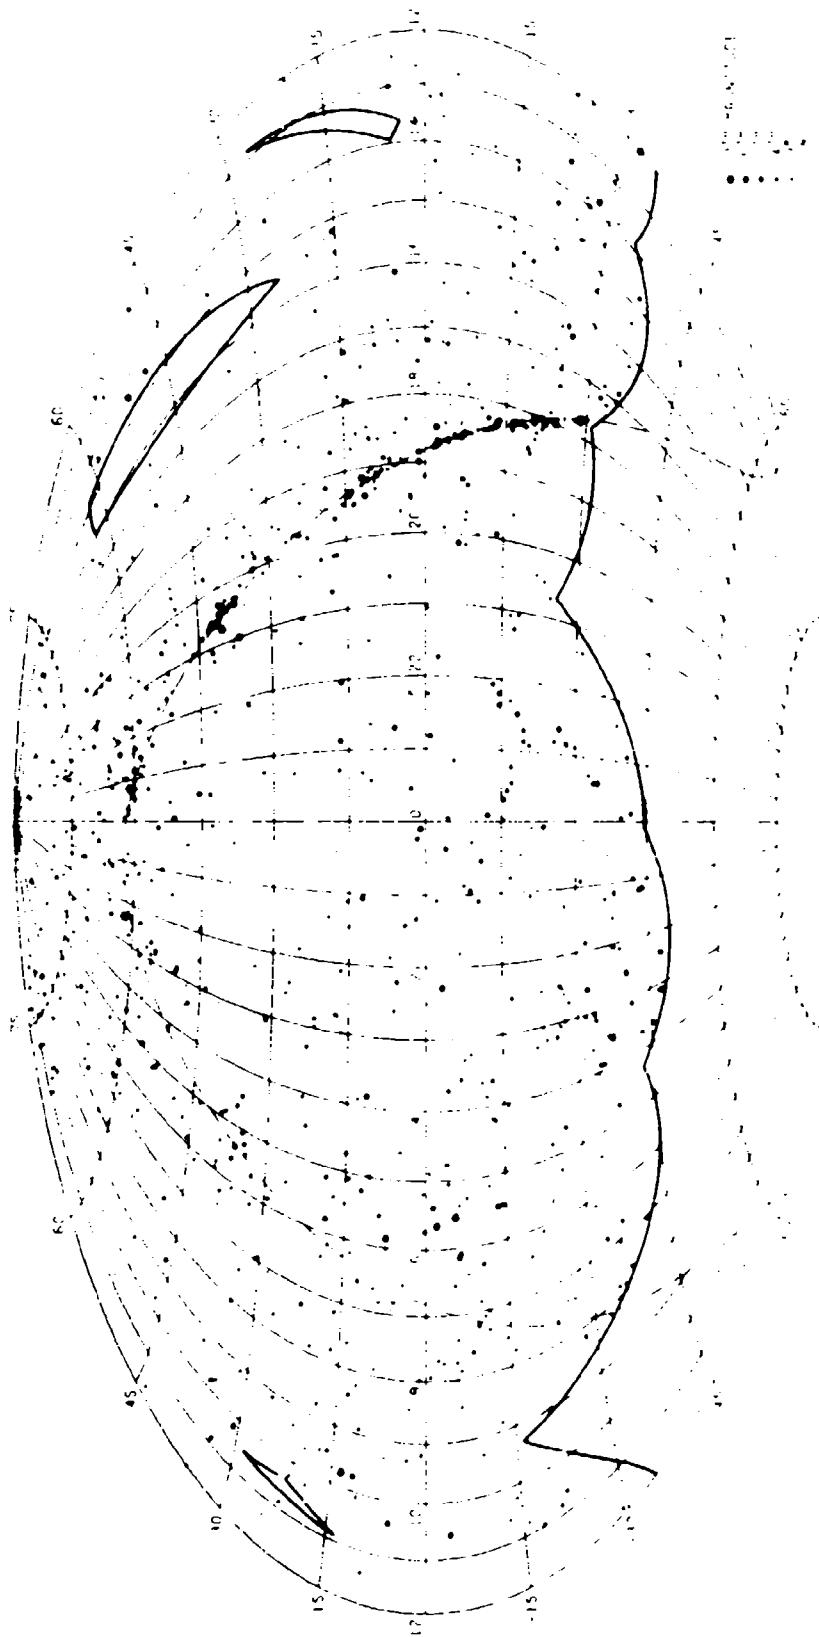

Figure 3. Distribution of 19.8 Micron Sources Plotted in Celestial Coordinates

Figure 4. Distribution of 4.2 Micron Sources Plotted in New Galactic Coordinates

Figure 5. Distribution of 11 Micron Sources Plotted in New Galactic Coordinates

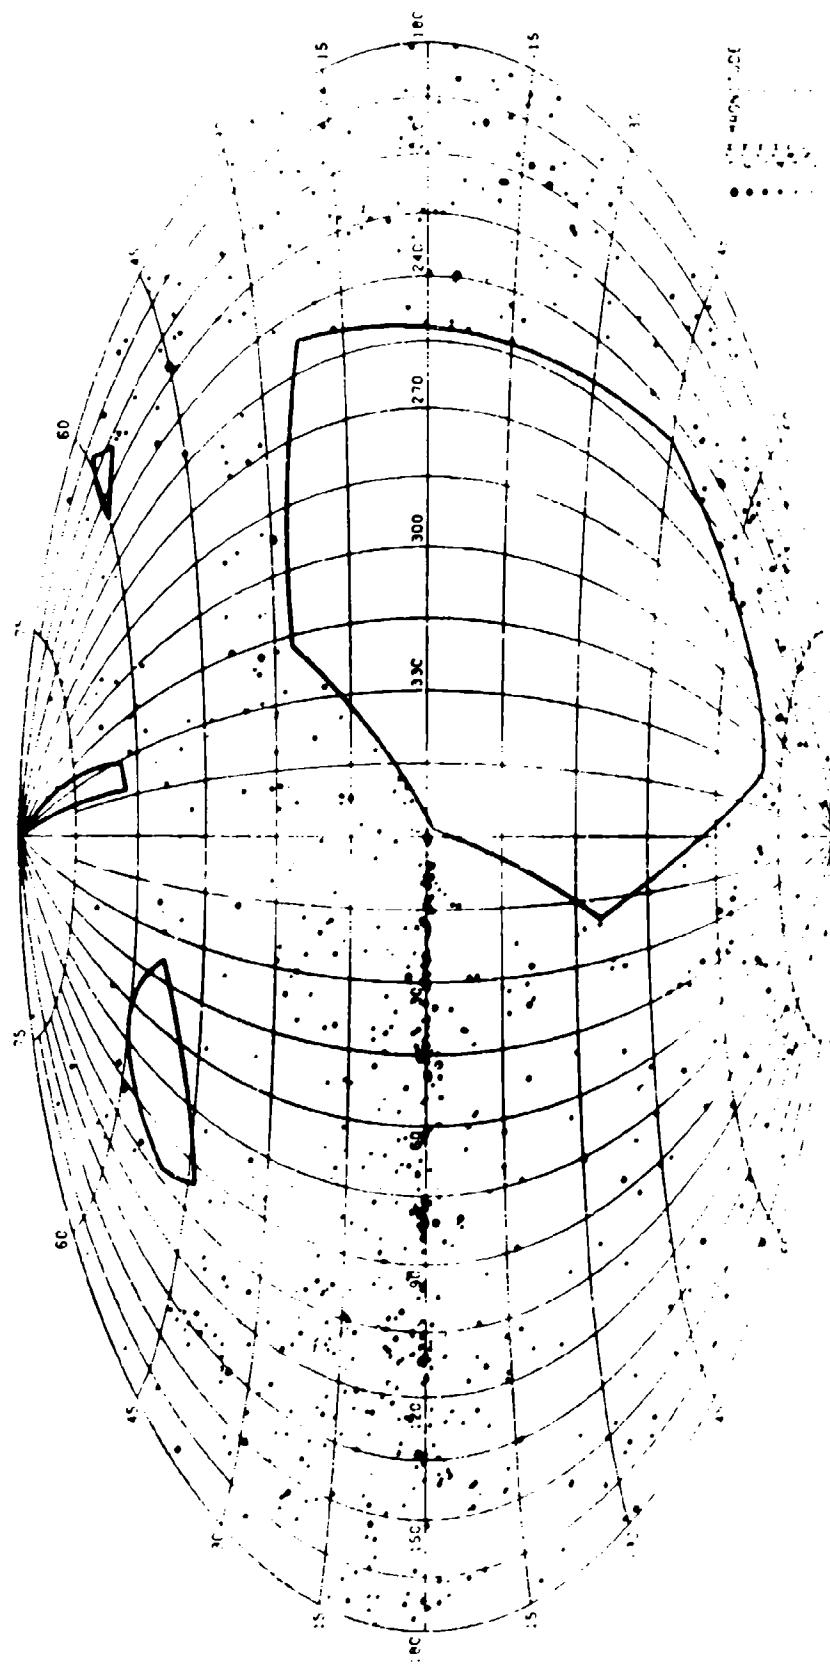

Figure 6. Distribution of 19.8 Micron Sources Plotted in New Galactic Coordinates

respectively. The heavy line in these figures defines the survey scan limits and the dotted line, about which many sources are concentrated, is the galactic plane. Figures 4, 5 and 6 present the same sources plotted in galactic coordinates.

For inclusion in the catalog, an observed source must satisfy stringent signal-to-noise criteria. In addition, any source scanned three or more times and observed only once was excluded regardless of its signal-to-noise ratio. Differences in channel-to-channel responsivity and variations in the system noise level during the observing period, combine to render the catalog incomplete at the faintest irradiance levels. Our analysis indicates that the catalog is statistically complete to $M(4) = +1.1$ $M(11) = -1.2$ and $M(20) = -3.2$ magnitudes. We emphasize that use of the catalog for statistical purposes at fainter magnitudes will lead to gross errors. It contains 2507 sources detected at 4.2 microns 1441 at 11 microns and 873 at 19.8 microns; 1344 out of the total 3198 sources were observed in more than one wavelength region and 279 were observed in all three spectral bands.

4. THE CATALOG

The catalog is divided into three parts: Part I - Table of Observations; Part II - A list of individual measurements on Multiply Observed Sources; and Part III - Remarks.

Part I - Table of Observations

1. COLUMN 1 - CATALOG NUMBER (CRL)

The sources are arranged in ascending order in right ascension. The CRL number is the catalog serial number assigned to the source.

2. COLUMN 2 AND 3 - COORDINATES (RA, DEC)

The measured right ascension and declination, precessed to epoch 1950, are given in these columns. The zenith encoder and stellar aspect sensor provide initial positions in rocket coordinates for sources detected on each flight. These positions were compared to IRC source positions (Neugebauer and Leighton¹) and converted to rocket coordinates to obtain associations between the CRL and IRC sources. The IRC positions were then used to determine any offset or bias angles present in the azimuth and zenith position for each sensor scan. The derived offsets were applied to all the measured source positions which were then converted into celestial coordinates. These are the coordinates tabulated for singly observed sources. Sources in the multiply scanned regions which were detected on different rocket flights, were considered to be the same source if their error boxes overlapped. In this case, the tabulated position is an average of the individual position measurements.

Due to the large number of references cited on this and the following pages, the references will not be foot-noted. Refer to list of references on page 155.

3. COLUMN 4 AND 5 - RIGHT ASCENSION (EA) AND DECLINATION (ED) ERROR BOX

An estimate of the positional uncertainty in right ascension is given in column 4 to the nearest second of time, and similarly for declination to the nearest tenth of a minute of arc in column 5. Positional updating, as described above, results in aspect solutions with errors much smaller than the field-of-view of a single detector. Thus, the positional uncertainties are dominated by the effective resolution of the detector elements, which includes the effects of detector-to-detector overlap. The resolution half widths in the scan and cross scan directions were transformed from rocket to celestial coordinates and the results tabulated for singly observed sources. For multiply observed sources, the individual error boxes were combined in the root sum square sense and the resultant reduced by the square root of the number of observations prior to listing in the catalog.

Histograms of the angular difference, in minutes of arc, between CRL and IRC right ascensions and declinations are shown in Figures 7 and 8. The rms of the deviations are 1.5 arc minutes in right ascension and 1.25 arc minutes in declination. Thus, the average position in the catalog may be two or three times more accurate than the error box associated with it, justifying the number of significant figures retained in columns 2 and 3. The CRL positions are on the average 2.4 arc seconds east and 3.6 arc seconds north of the IRC positions. This is

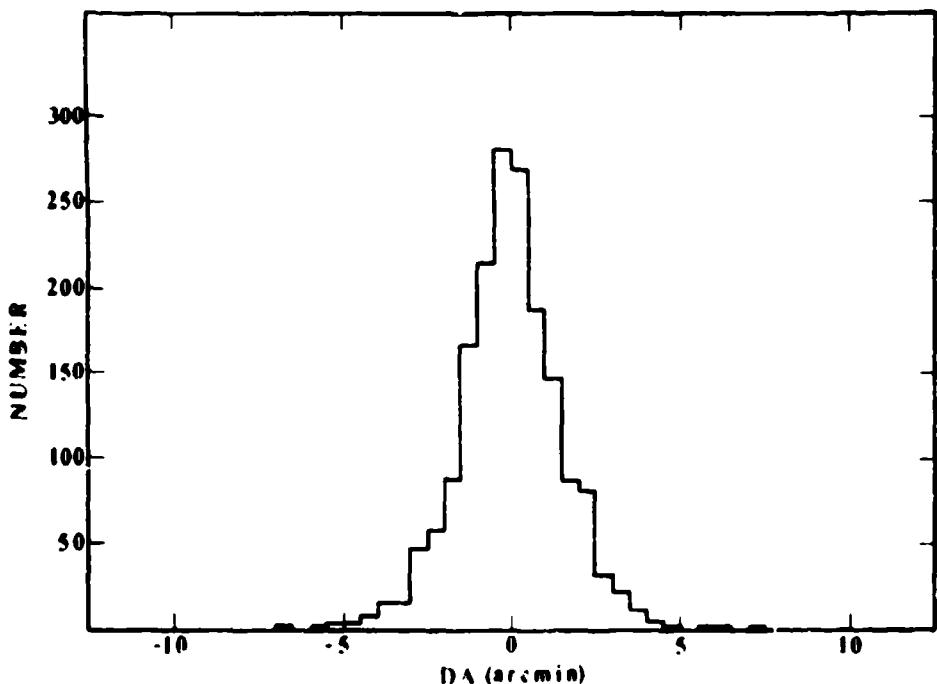

Figure 7. A Histogram for the Angular Difference in Right Ascension Found in the Survey and the IRC for all IRC Associated Objects. Differences are in terms of minutes of arc at the equator

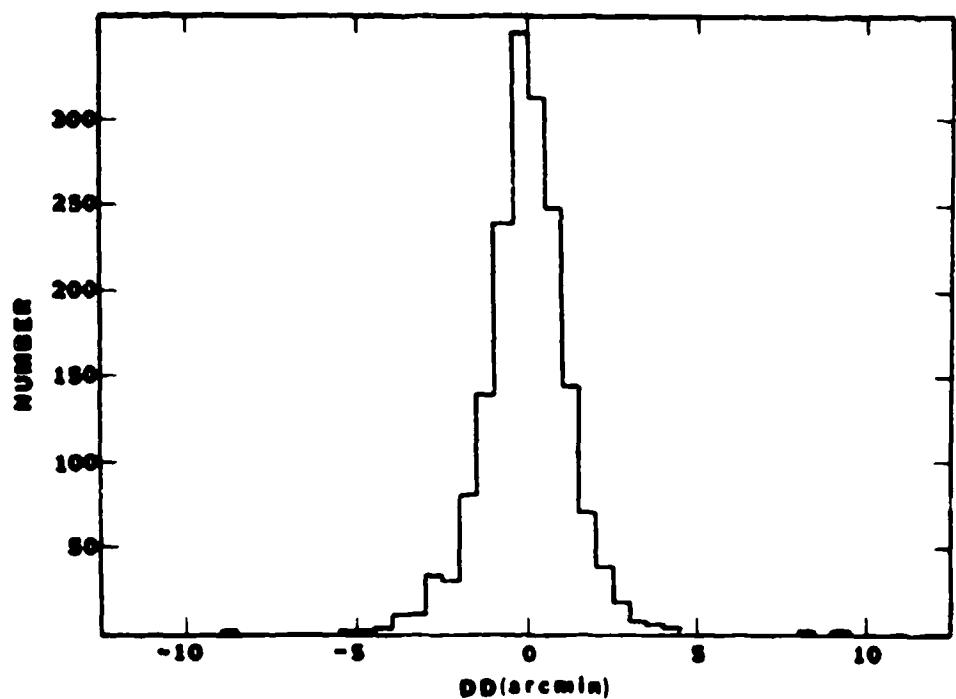

Figure 8. A Histogram for the Difference in Declination Found in the Survey and the IRC for all IRC Associated Objects

possibly due to errors in the adopted position of the zenith reference star used in the aspect solution.

4. COLUMNS 6 TO 8 - MAGNITUDES M(4), M(11) AND M(20)

The magnitudes measured at 4.2, 11.0 and 19.8 microns are contained in these columns and are titled M(4), M(11) and M(20), respectively.

A blank entry in one of these columns indicates that the source was scanned but not detected in that spectral band. An asterisk (*) means that the source was not scanned in that band. A "less than" designation (<) indicates that all measurements in this band were in saturation and the tabulated value is a lower limit. Magnitudes listed for multiply observed sources are the average of the individual measurements.

Each detector was individually calibrated for each rocket flight by a least squares fit of the observed system magnitudes to magnitudes derived from 2.2, 3.5, 11, and 20 micron ground-based photometry of IRC objects reported in the literature. Large amplitude infrared variables were discarded from this list of "standard stars" as were sources whose deviation from the best fit value was greater than 3σ .

The latter was done for two reasons. First, the degree of variability of some sources was unknown, and secondly, the large instantaneous field-of-view used in the survey can accept flux from extended regions. Consequently, the survey instrument can measure objects located in or near nebulosity as having significantly more flux than conventional narrow beam ground-based observations. Magnitude correlations for the 4.2, 11.0 and 19.8 micron bands are shown in Figures 9, 10 and 11. A horizontal line connecting two values in these figures represents the range of values reported in the literature for this source. The rms deviation is about ± 0.1 magnitude.

The following relations may be used to convert the observed magnitudes to spectral irradiance at the effective wavelength of the spectral band:

$$H(4.2\mu) = 3.6 \times 10^{-15} - 0.4M(4) \text{ Watt cm}^{-2} \mu^{-1}$$

$$H(11.0\mu) = 8.6 \times 10^{-17} - 0.4M(11) \text{ Watt cm}^{-2} \mu^{-1}$$

$$H(19.8\mu) = 8.2 \times 10^{-18} - 0.4M(20) \text{ Watt cm}^{-2} \mu^{-1}$$

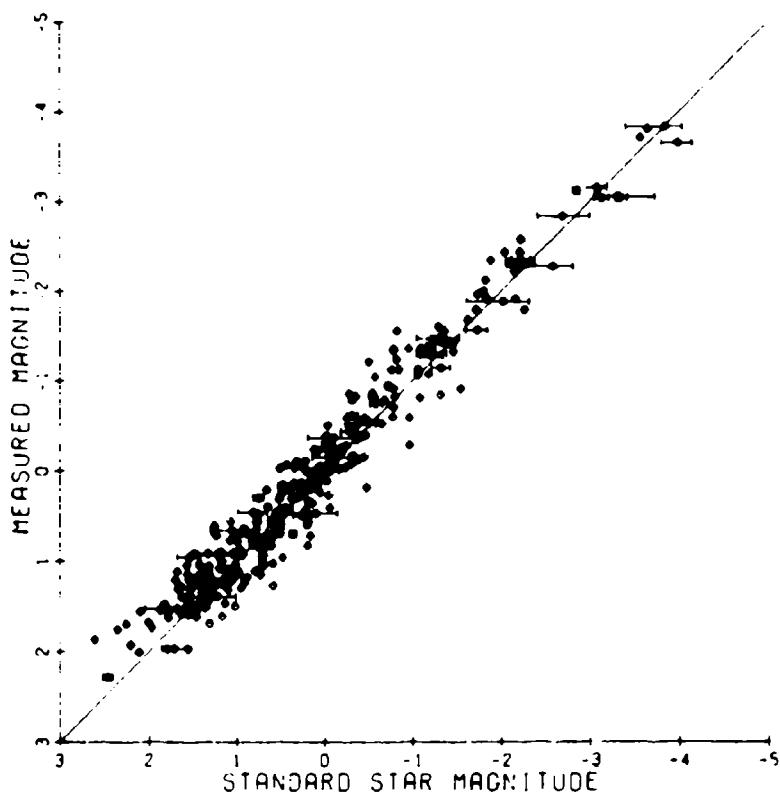

Figure 9. Correlation of Survey Magnitudes Measured at 4.2 microns With Those Derived From Ground Based Photometry of Associated IRC Objects

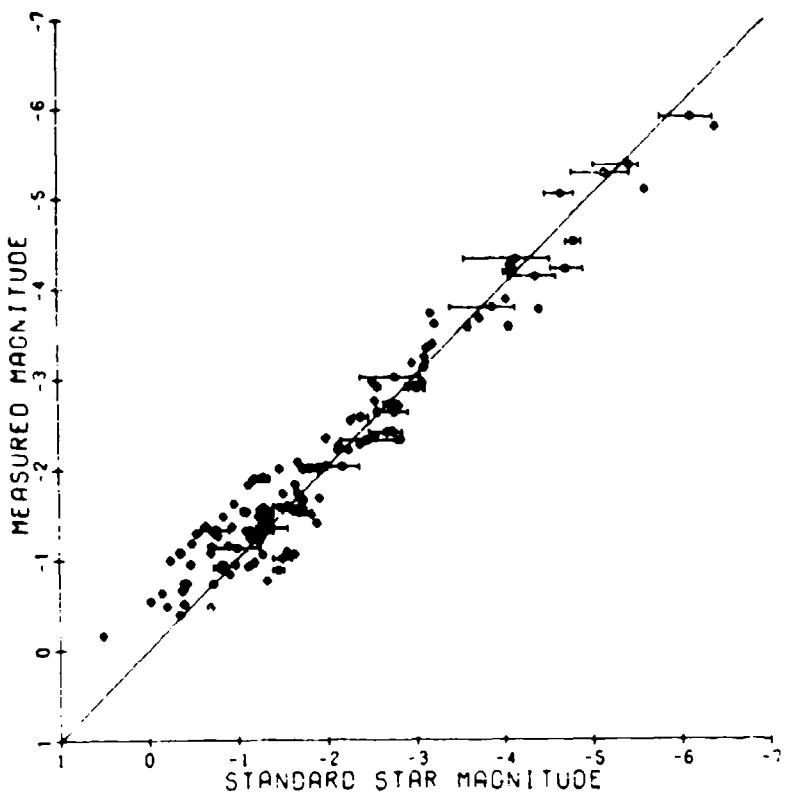

Figure 10. Correlation of Survey Magnitudes Measured at 11 Microns With Ground Based Photometry of Associated IRC Objects

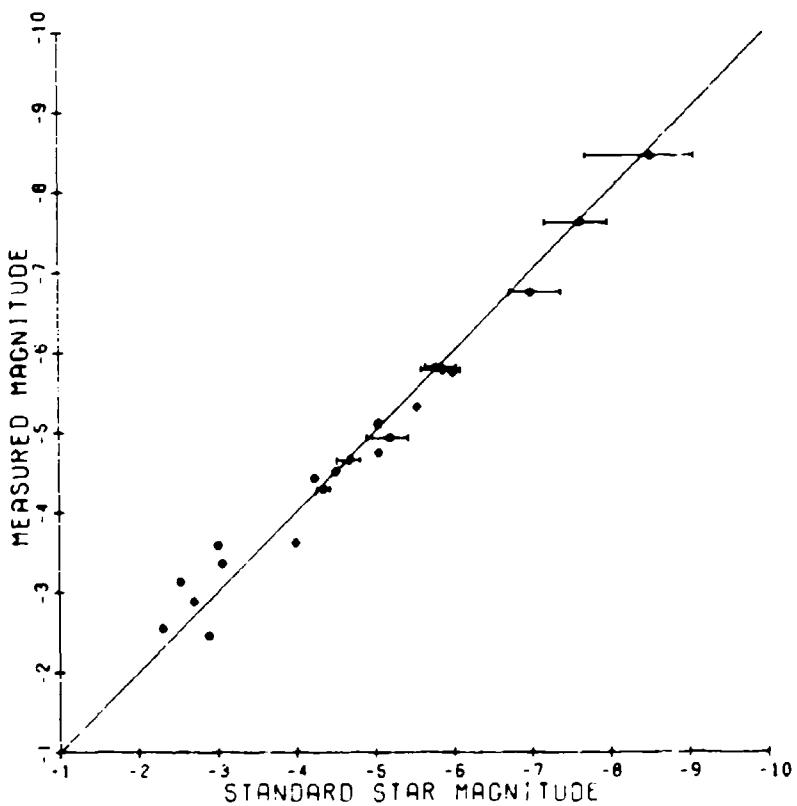

Figure 11. Correlation of Survey Magnitudes Measured at 19.8 Microns With Ground Based Photometry of Associated IRC Objects

5. COLUMNS 9 TO 11 - ASSOCIATIONS AND COMMENTS (IRC, BS, COMMENTS)

The IRC source, the Bright Star and/or other catalog designations, plus comments for celestial objects positionally associated with the CRL source are given in these columns. Primary associations were made in rocket coordinates if the CRL position was within a detector width and half height of a catalogued source. If more than one source fell within this box, the source closest to the CRL position was selected.

The IRC associations in column 9 are based on positions given by Neugebauer and Leighton¹ and from an extension of the 2.2 micron survey (designated by an E) of Neugebauer.² The Bright Star Number given in column 9, and the Bayer or Falmstead designations in column 10 are from Hoffleit.³ Columns 9 and 10 contain only primary associations.

Associations in column 11 are based on a hierarchy of catalogues and are not inclusive; that is, an association in one catalog may be omitted in favor of an association in another. The hierarchy used and catalog designation and reference are ordered as follows:

<u>Order</u>	<u>Prefix Designation</u>	<u>Reference</u>
1.	Bayer or Falmstead	Hoffleit, D. ³
2.	Variable Star	Kukarkin, B. V. et al ⁴
3.	SVS (Suspected Variable)	Kukarkin, V. V. et al ⁴
4.	CIT	Ulrich, B. T. et al ⁵

The references in the next level were considered equally. Entry into the catalog was based on being closest to the CRL source.

<u>Order</u>	<u>Prefix Designation</u>	<u>Reference</u>
5.	N or NGC (Revised New General Catalog)	Sulentic, J. W. and Tifft, W. G. ⁶
	I (Index Catalog)	Dreyer, J. L. E. ^{7, 8}
	SHARP	Sharpless, S. ⁹
	RCW	Rodgers, A. W. et al ¹⁰
	BRIGHT NEB	Lynds, B. T. ¹¹
	HFE	Hoffman, W. F. et al ¹²
	W	Westerhout, G. ¹³
6.	DO (Dearborne Observatory)	Lee, O. J. et al ^{14, 15, 16}

<u>Order</u>	<u>Prefix Designation</u>	<u>Reference</u>
7.	Case objective prism survey, designated by a reference number followed by a comma, then the star number in that ref.	(1) Nassau and Blanco ¹⁷ (2) Nassau and Blanco ¹⁸ (3) Nassau, Blanco and Morgan ¹⁹ (4) Nassau, Blanco and Cameron ²⁰ (5) Blanco and Nassau ²¹ (6) Nassau and Blanco ²²
8.	MWC (Mount Wilson Catalog) Merrill and Burwell ^{23, 24, 25}	

If no primary associations were entered in column 11, secondary associations were made if the positions were within 1.5 times the errors listed in columns 4 and 5, or were judged appropriate for catalogues of special interest such as the 100 micron survey catalog of Hoffman et al.¹²

In column 11, MU and NU were used for the Greek letters μ and ν , which introduces a redundancy with a possible variable star designation. No variable stars with MU and NU prefixes were associated with CRL sources.

An EO comment means that this object was observed to have significant angular extent with respect to the subtent of a detector in one or more colors, a majority of the number of times it was observed. The EO designation does not necessarily apply to all spectral bands and all observations of a particular source. An R comment refers to additional remarks about this source contained in the Remarks section. An A comment signifies that the source has a CRL cross reference which is detailed in Appendix A.

6. COLUMNS 12 AND 13 - GALACTIC COORDINATES (LII, BII)

The galactic longitude and latitude, in the l^{II} and b^{II} system, are given in these columns. The positions are listed to the nearest degree.

7. COLUMN 14 - OBSERVATIONAL STATISTICS (N)

The first number in this column gives the number of times the source was observed and the second is the number of times the source could have been observed.

Part II - Multiply Observed Sources

I. MULTIPLY OBSERVED SOURCES

The individual observations of multiply observed sources are given in this section. The table is divided into three main data blocks. In each data block, the first column lists the CRL number, the next three give the magnitudes measured at 4.2, 11 and 19.8 microns respectively, and the last column gives the Julian date of observation. The blank entry, asterisk(*) and "less than" sign (<) have the same meaning as in the main Table of Observations.

Preceding page blank

Part III - Remarks

1. REMARKS

This section lists remarks pertinent to various CRL sources. For the most part, they consist of secondary associations with the references previously listed. This section also lists all the secondary associations between the CRL sources and the Ohio State Radio Catalog edition 36. The OSU catalog and the following references to the prefixes are from Dixon, R.S..²⁶

Appendix A

During the past two years several papers have appeared (Cohen,^{1,2} Low,³ Cohen et al,⁴ and Ney⁵) which refer to CRL sources contained in preliminary versions of this catalog. The source designation has been changed. Table A1 cross references the CRL number in the current catalog with the published numbers from the preliminary catalog.

Table 1. Cross Reference of CRL Numbers with Preliminary Catalog Numbers

CRL	Prelim	CRL	Prelim	CRL	Prelim
67	412-0258	2104	416-1858	2370	423-1893
490	508-3363	2135	423-1836	2392	221-0986
618	819-0636	2136	423-1850	2396	213-0509
809	831-0628	2154	217-1228	2425	416-1825
865	603-1212	2155	713-0753	2428	819-2927
915	618-1343	2178	218-1233	2445	216-0646
961	610-1177	2179	408-1819	2494	219-0573
1274	517-1208	2192	409-1810	2513	222-0687
1686	712-1551	2199	212-1080	2591	809-2992
1922	219-1544	2205	218-1192	2679	804-2947
1949	733-1088	2259	213-1011	2688	803-2935
2015	425-1912	2341	217-0693	2885	916-3282
2023	423-1907	2350	218-0973	2985	915-3336
2086	423-1861	2359	217-0946
